Project Design Phase
Proposed Solution Template

Date	21-10-2026
Team ID	23KD1A0592
Project Name	Indoor Gardening Services Management (IGSM)
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Indoor gardening service requests are handled through emails or verbal communication. There is no central system to track the status of a request, no defined ownership, and no SLA or access control, which leads to delays in response and completion. The project aims to digitize and automate how these requests are raised and handled.
2.	Idea / Solution description	Develop the Indoor Gardening Services Management (IGSM) application in ServiceNow. Requesters submit a request through a catalog item (Record Producer) by choosing the plant type, service type, priority and description. The request is saved in a custom table that extends Task and moves from New to Assigned to Completed. Flow Designer takes care of manager approval, technician assignment and email notification, while SLAs and ACLs handle time limits and security.
3.	Novelty / Uniqueness	The solution brings the request form, automated approval and assignment, SLA tracking and role based security together in one ServiceNow application. It is built mostly with low-code features and minimal scripting, and it replaces the usual email and verbal requests with one simple end-to-end process.

S.No.	Parameter	Description
4.	Social Impact / Customer Satisfaction	Requesters can see the status of their request without following up again and again, and get a response faster. Technicians know exactly which requests are assigned to them, and managers get a clear view of all requests and SLAs. This improves transparency and accountability, and helps indoor plants get cared for on time.
5.	Business Model (Revenue Model)	IGSM is an internal service for an organization, so it does not earn revenue directly. The benefit is saved time and effort: fewer manual follow-ups, quicker service and better use of the technicians' time through SLA tracking.
6.	Scalability of the Solution	The solution is built as a scoped application on the ServiceNow cloud platform, so it can support more users and requests without any change to the setup. More service types, technicians and groups can be added easily, and the application can be packaged and deployed to other instances.
