Customer Problem Statement:

Organizations that offer indoor gardening services often face challenges in managing service requests efficiently. Requests are currently raised through emails or verbal communication, so requesters cannot see the status of their request and must follow up manually. This leads to delays in response and completion, unclear ownership, and reduced satisfaction for both requesters and technicians.

In addition, the absence of a centralized platform makes it difficult to track request status, measure response and completion times, and control who can view or modify each request. There is no SLA tracking and no access control. These limitations highlight the need for an automated, user-friendly, and role-based solution that simplifies how indoor gardening service requests are handled.

The proposed Indoor Gardening Services Management (IGSM) application leverages ServiceNow to digitize the entire request workflow using low-code features. Users submit requests through a service catalog Record Producer, and each request moves through the lifecycle New, Assigned and Completed. Flow Designer handles manager approval, technician assignment and notifications, SLAs track response and completion times, and ACLs secure the data by role. This helps reduce manual follow-ups, improve transparency, and ensure timely service delivery.

I'm	I'm trying to	But
An employee who needs an indoor gardening service such as watering, pruning or fertilizing, but has no single place to request it.	Raise a service request and track its status without depending on emails, verbal requests or repeated follow-ups.	Requests are handled through emails or verbal communication, so they are delayed, missed or left without an owner.

There is no centralized system with defined ownership, SLA tracking or role-based access control.	Confident that, using ServiceNow, requests can be raised, assigned and completed on time in one place.
