Project Name	Indoor Gardening Services Management (IGSM)
Maximum Marks	4 Marks

Solution Architecture:

The Indoor Gardening Services Management (IGSM) application is built on the ServiceNow platform using a layered architecture. Requesters use a Service Catalog item (Record Producer) to enter the plant type, service type, priority and description of their request. The business logic layer checks the request, sets the default priority and runs the approval and assignment flow. The data and service layer stores the request records and takes care of SLAs, security and email notifications.

- **User Interaction Layer:** Service Catalog gives requesters a self-service form to raise indoor gardening requests. Managers and technicians work on the same records from their request lists.
- **Business Logic Layer:** Catalog Client Script, Business Rule and Flow Designer work together to validate the input, set the default priority, get the manager's approval and assign the request to a technician.
- **Data & Service Layer:** A custom table that extends Task stores the requests, while SLA definitions, roles, groups and ACLs control the time limits and access. Email notifications keep the requester informed.
